```

class TicTacToe:

    def __init__(self, n: int):
        self.board = [[0] * n for i in range(n)]
        self.size = n

    def move(self, row: int, col: int, player: int) -> int:
        if self.board[row][col] == 0: self.board[row][col] = player

        for i in range(self.size):
            if self.board[row][i] != player: break
            if i == self.size-1:
                return player

        for i in range(self.size):
            if self.board[i][col] != player: break
            if i == self.size-1:
                return player

        for i in range(self.size):
            if self.board[i][i] != player: break
            if i == self.size-1:
                return player

        for i in range(self.size):
            if self.board[i][self.size-i-1] != player: break
            if i == self.size-1:
                return player

        return 0
  
```
