Given a list of scores of different students, return the average score of each student's **top five scores** in **the order of each student's id**.

Each entry `items[i]` has `items[i][0]` the student's id, and `items[i][1]` the student's score. The average score is calculated using integer division.

## Example 1:

Input: `[[1,91],[1,92],[2,93],[2,97],[1,60],[2,77],[1,65],[1,87],[1,100],[2,100],[2,76]]`

Output: `[[1,87],[2,88]]`

## Explanation:

The average of the student with id = 1 is 87.

The average of the student with id = 2 is 88.6. But with integer division their average converts to 88.

## Note:

1. `1 <= items.length <= 1000`
2. `items[i].length == 2`
3. The IDs of the students is between 1 to 1000
4. The score of the students is between 1 to 100
5. For each student, there are at least 5 scores
