1149. Article Views II

Medium 30 6 Add to List Share

SQL Schema >

Table: Views

```

+-----+-----+
| Column Name | Type |
+-----+-----+
| article_id  | int  |
| author_id   | int  |
| viewer_id   | int  |
| view_date   | date |
+-----+-----+

```

There is no primary key for this table, it may have duplicate rows.
 Each row of this table indicates that some viewer viewed an article (written by some author) on some date.
 Note that equal author_id and viewer_id indicate the same person.

Write an SQL query to find all the people who viewed more than one article on the same date, sorted in ascending order by their id.

The query result format is in the following example:

Views table:

```

+-----+-----+-----+-----+
| article_id | author_id | viewer_id | view_date |
+-----+-----+-----+-----+
| 1          | 3         | 5         | 2019-08-01 |
| 3          | 4         | 5         | 2019-08-01 |
| 1          | 3         | 6         | 2019-08-02 |
| 2          | 7         | 7         | 2019-08-01 |
| 2          | 7         | 6         | 2019-08-02 |
| 4          | 7         | 1         | 2019-07-22 |
| 3          | 4         | 4         | 2019-07-21 |
| 3          | 4         | 4         | 2019-07-21 |
+-----+-----+-----+-----+

```

Result table:

```

+-----+
| id |
+-----+
| 5 |
| 6 |
+-----+

```
